SUMMARY

Rust engineer specializing in on-chain protocols and trading infrastructure. Currently co-founding Saturn Protocol, a non-custodial covered-call vault on Solana. Previously the solo backend engineer on a live Aptos perp DEX, shipping production Rust market-making bots and high-throughput backends at 2,000+ events/sec.

TECHNICAL SKILLS

Languages: Rust, Python, TypeScript

Backend & Infra: Node.js, PostgreSQL, Redis, RabbitMQ, Docker

Frontend: Next.js, React, TradingView (advanced charting + custom indicators), Solana Wallet Adapter

Blockchain: Solana, Aptos

Trading Systems: Market-making bots, cross-exchange arbitrage, options vaults (covered calls), perps trading flows, on-chain indexers

EXPERIENCE

Saturn Protocol

Mar 2026 – Present

Co-founder & Engineer

Remote

- Co-building a non-custodial covered-call vault protocol on Solana — SOL depositors earn yield from weekly option premiums, no options expertise required.
- Designed and implemented 3 Anchor (Rust) programs — vault, options-token, Dutch auction — wired with cross-program invocation (CPI) and Pyth Receiver price feeds.
- Built the indexer + read API (Hono on PostgreSQL) with on-chain reconciliation against Helius webhook events.
- Built the vault dApp (Next.js + Solana Wallet Adapter) with full transaction-signing flow, on-chain state reads, and an optimistic pending-withdrawal overlay.
- Live on Solana devnet; mainnet pre-flight in progress (audit, KMS keypair, production RPC). Submitted to Solana Colosseum 2026.

Kana Labs

Jul 2024 – Mar 2026

Full-stack Developer

Remote

- Solo backend engineer on Kana's Aptos perp DEX product — owned the full pipeline from on-chain indexer to ETL to read API, running live in production.
- Built and deployed a production market-making bot (Rust) that provides liquidity within <0.05% spread of mark price (excluding ATR), minimizing inventory loss while maintaining continuous orderbook depth.
- Developed a cross-exchange arbitrage bot (Rust/Python) that offset market-making losses and achieved net-positive P&L, turning the trading operation profitable.
- Designed high-throughput backend handling 2,000+ events/sec (~200GB over 3 months) using Rust, PostgreSQL, WebSockets, and RabbitMQ.
- Scaled mission validation and wallet API for 20K+ participants, distributing 20K APT with T Wallet integration.
- Automated reward distribution systems across partners (T Wallet, Factblock, AhnLab), enabling seamless large-scale payouts.
- Delivered mobile-optimized trading frontend increasing platform adoption by 30%, improving accessibility and developer onboarding.

Kana Labs

Jan 2024 – Jun 2024

Frontend Developer

Remote

- Built leaderboards, live trading UIs, and custom charting across options, spot, and futures platforms.
- Integrated multi-chain Web3 stack (Arbitrum, BSC, Aptos) ensuring seamless wallet connectivity.
- Led a codebase refactor, improving maintainability and developer productivity.

Kana Labs

Oct 2023 – Dec 2023

Developer Relations (Dev-rel)

Remote

- Authored technical documentation and SDK samples, reducing onboarding time for external developers.

- Supported partners with smooth SDK integration, improving adoption and satisfaction.

EDUCATION

Gyeonggi University of Science and Technology

Associate of Science in Electronics & Control Engineering

2017 – 2023

South Korea

- Foundation in low-level programming, control systems, and optimization applied to software engineering.
